About me

Hi, I'm Floria. I'm a 23-year-old Master's graduate in UX Design, Cognitive and Computer Sciences from ENSC Bordeaux. I merge human psychology and UI to craft data-driven experiences. My approach is backed by 3+ years of dedicated practice and deep expertise in illustration, allowing me to build products that are as functional as they are visually immersive.

My Journey

Drawing has always been a part of me, more than a hobby, it just feels right. Eighteen years in, I keep growing at my own pace, always striving for more. While I create for the joy of it, my early art projects taught me crucial lessons in managing deadlines and handling feedback.

Over the years, I've channeled that discipline into **UX/UI design**, turning it into my primary craft. With solid, hands-on experience under my belt, it has become another canvas for balance, structure, and emotion—one where I solve real-world problems for real people. The process, the curiosity, and the joy of making, that's what drives me.

My education at ENSC didn't just teach me design, it gave me a foundation in computer science. This dual perspective is my strength. It allows me to design with a deep understanding of technical feasibility, ensuring my creative solutions are not only attractive, but buildable.

Intuitive by Nature

Great design shouldn't require a manual. I strive to create interfaces that feel natural and predictable, guided by a deep understanding of cognitive processes and user behavior.

● UX Design

Creativity with Purpose

For me, creativity isn't just about aesthetics, it's about innovative problem-solving. I use visual design to enhance clarity, communicate ideas, and create engaging experiences.

● Problem solving

Consistency is Key

A consistent design is a trustworthy one. I build robust design systems and component libraries to ensure a seamless and reliable user experience across every touchpoint.

● Design Systems

Experiences

UX/UI Designer Assistant

at Ubisoft — 2026

Led the design of a new internal process across Ubisoft teams to activate underused creator content. Conducted stakeholder interviews and workshops to uncover workflow bottlenecks, converging cross-functional constraints into a single, scalable pipeline.

UX/UI Lead Designer

at Stealth Startup — 2025

Co-led product strategy using UX research and competitive analysis to drive creative direction. I built a scalable Figma design system to accelerate development and ensure brand consistency.

UX/UI Consultant Intern

at Airbus & IMS — 2025

Optimized a learning platform's UX/UI by conducting user research and testing to resolve usability barriers. Managed stakeholder alignment to deliver timely, data-driven design improvements.

UX Instructor Intern

at ENSC — 2024

Led hands-on UX/UI workshops for high schoolers, teaching Figma and inclusive design principles by simplifying complex concepts into engaging, beginner-friendly lessons.

UCD — Three projects, one comprehensive approach

Ensc / Jan - Feb 2025

● Information Architecture

● Human Centered Design

● Usability Testing

● Problem solving

● Design Thinking

● Guidelines

● High-Fidelity Mockups

● Prototyping

This module at ENSC simulated a high-pressure professional environment across three distinct product phases. I practiced rapid immersion, taking over specifications from external teams and testing foreign concepts to ensure design agility and methodological rigor.

Methodology

Throughout the process, we followed the **Double Diamond** methodology: Discover (Immersion), Define, Develop, and Deliver.

Discovery, definition & ideation phase (Ridar)

The goal was to reduce bicycle theft. We began with a competitor benchmark and a literature review to identify major market trends.

What the data tells us

Data shows bicycle theft is a rapid, urban, daytime phenomenon; 50% of thefts occur during stops under 30 minutes, and 87% of victims were locked to fixed points. We defined our target as regular urban cyclists making frequent "flash" stops throughout the day.

Field Research

Observations in Bordeaux revealed a high reliance on proximity (93% stay within 10m of their bike) and extremely short locking times (23s). Interviews confirmed that "expensive bike anxiety" drives a primary need: the ability to monitor a bike remotely without the hassle of heavy locks for quick stops.

Ideation through the Purge

Using the **Purge method**, we cleared obvious ideas in 15 minutes to focus on innovation and feasibility. This led to the birth of **RIDAR**: a discreet, "phygital" anti-theft device integrated directly into the seat post.

Description

- Double suivi (vélo / propriétaire)
- Système de détection de la distance entre les deux (en temps réel)
- Application mobile (passive) : avec carte (localisation du vélo affichée)
- Détection de mouvement du vélo
- Système d'alarme (« CE VÉLO EST EN TRAIN D'ÊTRE VOLÉ ») et notification sur le téléphone (si le vélo est déplacé sans le propriétaire)
- Mode nuit (alarme désactivée mais notifications activées)
- Puces supplémentaires pour les pièces amovibles
- Système de sécurité installé à l'intérieur du cadre via le tube de selle

Avantages

- Ni lourde ni encombrante
- L'application fonctionne en arrière-plan (ce qui permet de gagner du temps puisqu'il n'est pas nécessaire de verrouiller l'écran), un avantage pour les arrêts rapides
- Visibilité « améliorée » du vélo
- Pratique pour localiser votre vélo ou ses pièces amovibles
- Presque tout le monde a son téléphone sur soi en permanence
- Facile à utiliser

Risques

- Un suivi permanent peut rebuter certaines personnes
- Il est toujours possible de retirer la puce
- Cela exclut les personnes qui ne sont pas à l'aise avec la technologie
- Risque d'embarras social (bruit de l'alarme) → mode nuit pour y remédier, au moins la nuit
- Risque d'erreurs GPS (en raison de la réverbération des bâtiments urbains, du grand nombre de vélos et du nombre de puces placées sur le vélo)

To ensure a smooth handover to the next team, we documented our findings in a detailed specification sheet, including:

- **Three User Personas:** Rayan (the delivery driver), Julien (the hurried dad), and Marc (the committed environmentalist), detailing their specific needs and pain points.
- **System Architecture:** GPS, BLE, GSM modules, and an audible alarm.
- **The Handover:** A crucial point where we specified that the app should remain a secondary, discreet support tool to avoid cluttering the user’s workflow (especially for delivery drivers).

Cahier de spécifications

Réduire les vols de vélo

Prototyping phase (Deskfriend)

The Challenge

In this phase, we pivoted to a new topic by taking over the specifications for a "Smart Desk" designed by another group. The initial specifications lacked detail and consistency. To build on a solid foundation, we held a supplementary brainstorming session to re-scope the need: improving the physical well-being (posture) and productivity (focus) of remote workers.

My Role (Design Lead)

I took full responsibility for the UI design and prototyping in Figma. Beyond the visual design, I mentored my teammates on best practices, including the use of Auto Layout and Component-based design to ensure global consistency.

The Solution

A remote-control application to manage the workspace: real-time posture analysis, **move** reminders, acoustic isolation management via physical panels, and a **Focus Mode** to limit mobile distractions.

Mode Focus

User testing phase (Smart Cart)

Testing Protocol

The final phase involved testing the prototype of a third project: an autonomous, connected supermarket cart. We conducted guerrilla testing at a local supermarket (Leclerc Pessac) with 9 participants. The objective was to validate the usability of key features: connecting to the cart via QR code, managing the shopping list, and mobile payment.

Test Results

Testing validated the core flow (9/9 success) but identified a visibility friction point with the "Connect" button. Users expressed a desire for "paper mimicry" (checking items off), and results highlighted the "Human Factor": 5 out of 9 testers still preferred traditional checkout to maintain social contact.

Conclusion

This module taught me how to navigate uncertainty and remain flexible. Moving from urban security to productivity tools, and finally to retail solutions, reinforced a core truth: while the subject matter changes, the rigor of the User-Centered Design methodology remains the only guarantee of a successful product.

VMT — Optimization of a training and learning platform

IMS & Airbus / May - Jul 2025

 **Under NDA**

- Human Centered Design
- Information Architecture
- Data Analysis
- User Interviews
- Heuristic Analysis
- Design Thinking
- Gamification

Completed a Cognitive Engineering internship at IMS Bordeaux in partnership with Airbus Helicopters. I analyzed and optimized the **Virtual Maintenance Trainer (VMT)**, a specialized training system developed in collaboration with Telespazio.

Role	My role was to work as a sort of UX consultant: analyzing usage patterns, understanding users and the issues surrounding underutilization, and suggesting ways to improve the training experience.
Challenge	The VMT suffered from low adoption due to interface complexity, confusing 3D navigation, and poor alignment with teaching practices. The main challenge was to uncover usability barriers, simplify the interface, and propose feasible improvements that respected Airbus's technical and operational context.
Objectives	• Diagnose causes of low engagement and usability issues. • Redesign navigation and interface for clarity and efficiency. • Align the tool with real classroom workflows and cognitive demands. • Deliver ready-to-implement mockups and recommendations.

Research & Insights

Using a User-Centered Design (UCD) approach, I prioritized instructors and students to ensure clinical relevance.

Methods

- 7 semi-structured interviews with instructors and trainees.
- Field observations of real training sessions.
- 3 user surveys using UMUX criteria (75 participants in total)

Key Findings

- Non-intuitive 3D navigation causing disorientation.
- High click precision and excessive controls increasing cognitive load.
- Visual clutter and inconsistent menus leading to frustration.
- Tool complexity not matching learners' experience level.

These insights revealed that simplification and contextual adaptation were key to improving adoption.

I categorized the issues using the Colombo and Pasch heuristic matrix to assess their impact and feasibility. The top priorities were as follows

- Simplify 3D controls.
- Solve the high-precision click issue.
- Streamline menu structure.
- Align detail level with user expertise.

Colombo & Pasch’s 10 Heuristics

1. Clear Goals
2. Appropriate Feedback
3. Focused Concentration
4. Ergonomical Transparency
5. Technology Appropriation
6. Challenges/Skills Balance
7. Potential control
8. Follow the Rhythm
9. Know Thy User’s Motivations
10. Conservative Innovation

Problem	Cost	Priority
Difficult 3D navigation	High	*
Click too precise	Medium	*
Unintuitive interface and menus	High	*
Level of detail unsuited to the expertise	High	*
	Low	
	Medium	*
	High	
	High	*
	Low	
	High	
	Medium	*
	Low	*

Ideation

Following brainstorming and co-design sessions with Airbus experts, I developed proposals focused on cognitive simplicity and alignment with work processes. The redesigned interface emphasized

- Simplified 3D manipulation and camera controls.
- Reduced interface density and contextual menu logic.
- Clear visual hierarchy and hover feedback.
- Modernized visuals aligned with Airbus's UI standards.

These improvements aimed to make the VMT more intuitive, less cognitively demanding, and better integrated into training sessions.

Conclusion

This internship at Airbus & Telespazio provided deep experience applying UCD to complex industrial systems. Focusing on the research and ideation phases of the Double Diamond, I established a foundation for future 3D interaction testing. I sharpened my cognitive engineering skills by simplifying high-density interfaces, balancing pedagogical goals with industrial constraints to transform the VMT into a high-value learning asset.

Letter of recommendation

“ From May to July 2025, Ms. Floria LEGER completed her second-year engineering internship at ENSC as part of a partnership between ENSC, Aerocampus, and Airbus Helicopters. The focus of the internship was improving the user interface of a virtual reality-based training tool designed for aircraft maintenance.

In a work environment involving multiple stakeholders, Ms. LEGER quickly adapted to this new professional environment and rapidly grasped the challenges of the internship. Furthermore, she demonstrated independence in her work and was proactive in offering suggestions. She is a curious, hardworking young person with excellent interpersonal skills.

I enthusiastically recommend Ms. LEGER, confident that she will provide you with complete satisfaction in terms of both her technical skills and her personal qualities. ”

A handwritten signature in black ink, appearing to read 'Roudil', with a long horizontal stroke extending to the right.

— Roudil Léna, Training Coordinator for Technicians

EmCo — Disassociate cognition from emotion

Ensc / Jan 2026

- Human Centered Design
- Competitor Analysis
- Data Analysis
- High-Fidelity Mockups
- Prototyping
- Design Thinking
- Usability Testing

This intensive five-day sprint was the result of a collaboration between the ENSC (Cognitive Engineering School) and the STAPS (Sports Science Department).

Role & Challenge

As Figma Lead, I directed the wireframing and prototyping process, ensuring a rapidly testable design while mentoring the team on UI/UX best practices. The core challenge was utilizing non-invasive sensors to accurately distinguish between fatigue and stress during specialized tasks.

The team

A multidisciplinary group of six members (STAPS and ENSC), combining expertise in sports physiology and cognitive engineering.

Methodology

We followed the Double Diamond method (Discover, Define, Develop, and Deliver). Due to the tight deadline, we performed a major design iteration immediately following our user testing phase.

Discovery & definition phase

Research focused on differentiating emotion from cognition using models by Ekman and Russell. We targeted ergonomists, identifying a need for objective, real-time data to supplement clinical interviews. This allowed for a more accurate evaluation of office workers' states through live source data.

Russell’s (1980) Circumplex Models

The Concept

Equipping workers with textile sensors (socks for electrodermal activity, a T-shirt for heart rate) and an eye-tracker to transmit real-time data to a dedicated tablet application for the ergonomist.

Ideation & prototyping phase

I designed a four-module interface (Analytics, Equipment, History, Reporting) that visually distinguishes cognitive "Flow" from emotional states using Russell’s Circumplex Model. Key features include a **Hybrid Labeling System** for immediate readability, a **Reliability Indicator** to signal "noisy" sensor data, and **FaceID Authentication** for secure, GDPR-compliant data access.

User testing, analysis & iteration phase

On the third day, we conducted usability testing with ENSC faculty and PhD students using a rigorous protocol: targeted tasks, qualitative feedback (verbatims), and the Attrakdiff questionnaire.

Attrakdiff Results

- Stimulation, Identification, and Attractiveness: Very positive scores (1.5; 1.1; 1.6). The interface was perceived as professional, reassuring, and engaging.
- Pragmatic Quality: Slightly negative score (-0.5). The interface was judged as too dense and occasionally confusing for first-time users.

Major Iteration

The emotional state diagram, originally presented as a heatmap, was completely misunderstood by testers. To resolve this critical pain point, I simplified the visualization to show only the current state while adding a much more intuitive "time slider" to review past data.

Conclusion

This project highlighted the complexity of distinguishing emotion from cognition—a challenge that remains at the forefront of research. From a UX perspective, it proved that when dealing with abstract data, visual simplicity is the only way to ensure user comprehension. Moving forward, testing with practicing ergonomists would be essential to further refine the relevance of the proposed biometric indicators.

Inspiration Sources

Human Behavior

Trained in cognitive science, I've always been fascinated by why people do what they do, drawing continuous inspiration from everyday human behavior.

Technological Innovation

I'm always exploring new tools, frameworks, and design trends. I'm an avid follower of creators on Twitter and other platforms, constantly learning from the best in the field.

The World Around Me

I find design lessons everywhere, from the deliberate composition of an illustration to the subtle, unwritten rules of how people navigate a busy public space.
